Notes element

- General note(s):
 - Historical Note: The Voyager mission (previously known as Mariner Jupiter Saturn 1977) was a NASA-sponsored flight project. The twin Voyager spacecraft, over the course of a dozen years, drew back the curtain on nearly half of the solar system. From launch in 1977 through the spectacular parting shots of Neptune at the outer reaches of the solar system in 1989, this pair of spacecraft explored four planets: Jupiter, Saturn, Uranus, and Neptune, as well as dozens of moons, and the rings and magnetic environments of those planetary systems. The Voyagers were designed to take advantage of a rare alignment of the outer planets that occurs only once every 176 years. The configuration allows a single spacecraft to swing by all four gas giants receiving a 'gravity assist,' thereby eliminating the need for large on-board propulsion systems. The flyby of each planet both accelerates the spacecraft and bends its flight path. Without these gravity assists, the flight time to Neptune would have been 30 years.
The second of the two Voyager spacecraft, Voyager 2, was launched first, on 1977-08-20. It was followed on 1977-09-05 by Voyager 1, which had a faster, shorter trajectory to Jupiter. Both launches took place from the Cape Canaveral Air Force Station in Florida. The Voyager mission makes up the longest, furthest, and most complex of any unmanned mission to this point.
- Specialized note(s):
 - Conservation: Standard preparations of documents for long term storage were completed.
 - Processing information: No processing accommodations performed for this collection.
